

Report on Demographics of Persons under the age of 21 years with Hearing Aids - 2010

This report contains demographic information on young people under 21 years of age fitted with hearing aids or cochlear implants in Australia as at 31 December 2009, and who were provided with audiological, hearing aid, and/or cochlear implant speech processor support services, through Australian Hearing. The data provides information at National and State / Territory levels and has been collated from Australian Hearing’s client record management system databases (as a ‘snapshot’).

The major characteristics of the report show:

- recorded aided people up to 21 years of age at 31 December 2009
- data on young people who were first fitted with hearing aids to 31 December 2009

Care should be taken in comparing information from previous reports, and particularly prior to 2007, due to some differing parameters used in data collation.

Taking the above comments into account, and for this type of report, the present report shows:

- number of aided young people shown in this type of ‘snapshot’ report (15,515)
- number of young people fitted for the first time in 2009 (2,035)
- number of young people by hearing loss group, (3 FAHL = the average hearing level (in dBHL) of thresholds at 500, 1000 and 2000 Hz, in the better ear)
- children born in the most recent birth year continuing to have the greatest proportion of young people fitted for the first time in 2009. This is consistent with the continued expansion of new-born hearing screening in Australia
- increasing births in recent years, with 2008 having highest recorded births by ABS
- number of Indigenous young people fitted
- continuing high numbers of young people fitted for the first time in previous 12 month period being at initial school entry ages

A list of Tables and Figures included in the report follow.

Table 3 – Young People <21 years old and first fitted in 2009 – by 3FAHL Better Ear Group and Birth Year

*Report on Demographics of Persons under the age of 21 years with Hearing Aids – 2010
(continued)*

- There are 1,544 Indigenous young people fitted with hearing aids (almost 10% of all aided young people). ABS Census 2006 population data indicates that about 4% of all people under 21yrs nationally are Indigenous. Indigenous children have a higher incidence of chronic middle ear disease and therefore potential for hearing aid fitting, than non-Indigenous children; as a result it is reasonable to expect that Indigenous children will form a higher proportion of the aided child client base than they do of the general population.
- Of all young people fitted for the first time in 2009 (2,035), 310 were Indigenous young people. Tables showing profiles of Indigenous young people by State/Territory, age at first fitting, 3FAHL better ear, and by birth year are included below.
